01 / THE OPERATOR PROBLEM

A blocked transfer.
An unanswered question.

Enforcement is a rule. Diagnosis is an operator task.

CAUSE

Why was it blocked?

Which proof or asset policy explains this result?

IMPACT

What else changed?

Which assets rely on that same eligibility proof?

RESOLUTION

Is it actually fixed?

Does fresh state support the proposed recovery?

Problem hypothesis: founder experience + public ecosystem documentation. No named operator case or interview evidence yet.

02 / THE DIFFERENTIATION HYPOTHESIS

Not new data.
A repeatable workflow.

Cause → shared impact → correction → fresh-state verification.

MANUAL ALTERNATIVE

Scripts + an explorer

Can expose the underlying facts.
We do not claim these tools cannot solve the task.

AVEO'S PROPOSED ADVANTAGE

One operational path

Context, grouped incidents and verified recovery.
Compare task time, manual actions and errors.

Tokeny already has servicing tools; no superiority claim. Our initial focus is Solana, not replacing an EVM platform.

03 / WHY SOLANA

Portable insight.
Native Solana implementation.

The chain choice is concrete — not an exclusivity claim.

IMPLEMENTED INTEGRATION

SAS + Token-2022

Reusable eligibility facts.
Transfer Hook checks during token transfers.

AN ERC-3643 VERSION WOULD NEED

Different adapters

Proof readers, transaction builders
and transaction/state verification.

Solana-only today. EVM and MPL-3643 integrations are not implemented. MPL-3643 is a related framework, not our integration.

04 / THE BUYER AND BUSINESS

An operator uses it.
A platform could buy it.

Start with multi-asset permissioned-token platforms on Solana.

USER / HYPOTHESIS

Operations + compliance

Investigates blocked transfers and coordinates remediation.

BUDGET / HYPOTHESIS

Head of operations

Confirm who owns the problem, approves tools and signs the budget.

REVENUE / HYPOTHESIS

Subscription + integration

Propose a paid pilot.
Price and willingness to pay are unvalidated.

No revenue, customer commitment or validated monthly price is claimed.

05 / THE DEMONSTRABLE CANDIDATE

Inspect today.
Prove the full loop next.

Public devnet candidate — not a completed two-minute user journey.

AVAILABLE OBSERVATION

Live policy and proof diagnosis

Deployed program and test accounts.
Read-only browser evidence; synthetic eligibility.

REQUIRED BEFORE FULL-FLOW CLAIMS

Wallet + recovery acceptance

Provision the test wallet; record six scenes.
Observe a newcomer without coaching.

Real-wallet execution, full security and six-scene signoff remain open. No real KYC or independent professional audit.

06 / BUILT TOGETHER

Domain experience.
A new generation of builders.

One shared ambition: make eligibility understandable and actionable.

THE TEAM

Experience + fresh perspectives

20 years in audit and compliance, a Computer Science background and four Information Systems students.

OUR COLLECTIVE WORK

From rules to a working Desk

On-chain policies, SAS integration, backend, interface and verification tooling—built together.

AI-assisted development. Public devnet demonstration with synthetic eligibility data; not an independently audited production system.
